

Meanwhile in the world of morphology ...

Time. Efficient.

In healthcare, time is often a critical factor. This is especially true in the lab, where the result of the analysis may determine the correct treatment. In critical or complex situations, a second opinion is often used to make sure that the analysis is correct.

A second opinion requires the blood sample to be transported from A to B. In the analogue world, this involves physical transportation of the blood sample – sometimes within the hospital compound, sometimes from one hospital to another. In either case, it is a cumbersome and time-consuming operation.

With CellaVision's systems, moving digital images from A to B takes place in a matter of seconds regardless of distance, location, flights of stairs or malfunctioning elevators, allowing for a time efficient consultation.

Work smarter and perform better.
